

Lab-05 Logistic Regression

Hypothesis : $H(X) = \frac{1}{1 + e^{-w^T x}}$

$$H(x) = P(X=1; w) \\ = 1 - P(X=0; w)$$

$$\text{hypothesis} = 1 / (1 + \text{torch.exp}(-(x_{\text{train}} \cdot \text{matmul}(w) + b))) \\ = \text{torch.sigmoid}(x_{\text{train}} \cdot \text{matmul}(w) + b)$$

$$\text{Cost: } \text{Cost}(w) = -\frac{1}{n} \sum y \log(H(x)) + (1-y) (\log(1-H(x)))$$

$y \approx H(x)$ 이면 거의 0, $y \neq H(x)$ 이면 대략 0.5

$$\text{loss} = -(y_{\text{train}} * \text{torch.log}(\text{hypothesis}) + \\ (1 - y_{\text{train}}) * \text{torch.log}(1 - \text{hypothesis}))$$

$$\text{Cost} = \text{loss.mean}()$$

$$= F.\text{binary_cross_entropy}(\text{hypothesis}, y_{\text{train}})$$

$$\text{Weight update via Gradient Descent: } W := W - \eta \frac{\partial}{\partial W} \text{Cost}(w)$$

$$\text{prediction} = \text{hypothesis} \geq \text{torch.FloatTensor}([0.5])$$

$$\text{correct_prediction} = \text{prediction.float()} == y_{\text{train}}$$

$$\text{model} = \text{BinaryClassifier}()$$

$$\text{optimizer} = \text{optim.SGD}(\text{model.parameters}(), lr=1)$$
